Preface

This book¹ aims to provide the *why* and the *how* of uncertainty visualization. The *why* is based on what we currently know about how people interpret and make decisions from uncertainty visualizations, and the *how* is structured around generating uncertainty visualizations using the R programming language and the grammar of graphics.²

¹or what it will be—it is a work in progress

²as implemented in the *ggplot2* package (Wickham et al., 2018)

Chapter 1

Introduction

TBD

Chapter 2

Why uncertainty visualization is hard

- Efficient encodings for uncertainty can be hard to find
 - try putting mean, variance, and interval estimation in one plot + doing this when useful channels are already used up
- Even if you get the encoding right have to contend with making sure people understand it
 - explain a CDF to someone
- Even if people understand have to deal with how people perceive uncertainty
 - linear-in-log-odds and other perceptual models of probability
- Even if people correctly perceive the uncertainty have to deal with how people make decisions under uncertainty
- Even if you solve all these problems in one context a new context may cause your solution to break
 - see e.g. deterministic construal errors
- Plus, you still have to build the damn thing
 - But some strategies for building uncertainty vis using the grammar of graphics helps a lot here (the **how** of this book)

Chapter 3

Foundations: Uncertainty as we'll see it

- primarily Bayesian perspective
 - unifies aleatory and epistemic
 - gives us one framework to work in
 - simplifies building things
 - simplifies communicating things (see e.g. confidence fallacy)
- will still occasionally touch on frequentist, usually as a subsection at the end of each chapter:
 - tips on how to translate the visualization techniques presented into that mode
 - at times, visualizations unique to the frequentist approach that might be useful

Chapter 4

Foundations: Uncertainty and the grammar of graphics

- basic strategies for applying uncertainty visualization within the grammar of graphics
- visual channels, marks, etc. (and mapping onto ggplot)
- simple prediction grid example

Chapter 5

Discrete data

- categorical
 - proportions
 - * product plots / mosaic plots
 - icon arrays
 - * unit visualizations
 - HOPs-like stuff
 - entropy-based approaches
- ordinal / integer
 - proportions
 - histograms
 - CDFs
 - dotplots
 - ...

Chapter 6

Continuous data

not sure of the organization here, especially within multivariate...

- univariate
 - densities, gradients
 - CDFs
 - intervals
 - quantile dotplots
 - HOPs
- multivariate
 - the joint case
 - * gradients
 - * contour plots
 - the conditional case
 - * gradients
 - * bands
 - generalizing quantile dotplots to multiple dimensions: representative sampling approaches
 - * scatterplots
 - * spaghetti plots
 - HOPs
- frequentist addendum
 - interpreting in a Bayesian mode: advantages and pitfalls (and what it reveals)
 - * *this maybe goes elsewhere*
 - those double-sided p value plot things

Chapter 7

Dealing with multiple uncertainties

- a note on comparisons
 - univariate marginals might bite you...
- aleatory / epistemic (or parameter space / data space)
 - frankenplots maybe (product plots / mosaic plots / unit visualizations)
 - animation
 - * NYT needle
 - * Galton boards
- mixing discrete and continuous
 - color with densities
 - HOPs
 - some hurricane stuff
